1 Introduction

Theory construction in terms of AGDA programming

2 Discussion

recursion (the lack thereof)

extensions: for example, iteration, view dependency

Haskell implementation

Towards a dependently typed version

stems from work on BiFLUX; comparison with putlenses

Theory construction in terms of AGDA programming

Regarding formalisation: “[W]e are interested in extending what can be calculated precisely because we are not interested in the calculations themselves. Developing techniques that allow more of a derivation to be calculated allows attention to be focussed on the creative parts, which cannot be calculated.” [?]
